

NEOMARKET - Detailed Project Explanation

1. Problem Statement

NeoMarket addresses major digital ecosystem challenges such as service fragmentation, time consumption caused by switching between applications, complex payment processes, limited vendor visibility, poor service coordination, lack of data-driven insights, and scalability limitations in traditional single-service platforms.

2. The Gap in Current Solutions

Current digital platforms operate in isolation. Users must create multiple accounts, manage different payment systems, and navigate inconsistent interfaces. There is no centralized environment that integrates services into one seamless experience. Additionally, small and local vendors lack visibility and digital empowerment.

3. Proposed Solution: The Super App Model

NeoMarket introduces a unified Super App ecosystem where multiple services coexist within one platform. Users access services using one account and one payment system. The platform integrates service discovery, ordering, payment processing, and tracking into a single intelligent interface.

4. System Architecture

Level 0 Architecture: The system connects three main entities: Customers, Vendors, and Admin, all interacting through the Marketplace Platform. Level 1 Workflow: 1. Vendor Onboarding 2. Product Listing 3. Customer Order Placement 4. Secure Payment Processing 5. Fulfillment and Review 6. Commission Calculation and Vendor Payout

5. Key Requirements

Functional Requirements include vendor management, secure payment integration, customer tools, and communication systems. Non-Functional Requirements include scalability, high availability, fast performance, data security, and mobile-friendly usability.

6. Targeted Beneficiaries

Consumers benefit from convenience and unified payments. Businesses gain visibility, analytics, and lower operational costs. Developers access APIs and mini-app deployment opportunities. The Platform Owner benefits from diversified revenue streams and ecosystem growth.

Conclusion

NeoMarket is a scalable, intelligent digital infrastructure designed to unify services, empower vendors, enhance user experience, and create sustainable ecosystem growth. It represents the evolution from isolated applications to a connected Super App model.
